Lab 1:

Create a templet Class List as dynamic array with the following methods

Method	Description	Return value
`append(x)`	Add one item to the end	`None`
`extend(iterable)`	Add multiple items to the end	`None`
`insert(i, x)`	Insert an item at a specified index	`None`
`remove(x)`	Remove the first occurrence of a value	`None`
`pop(i)`	Remove and return an item at index `i`	Removed item
`clear()`	Remove all items	`None`
`index(x)`	Find the index of the first occurrence	`int`
`count(x)`	Count occurrences of a value	`int`
`sort()`	Sort the list in place	`None`
`reverse()`	Reverse the list in place	`None`
`copy()`	Create a shallow copy	New list

2) implement a new search method “jump Search”

3) compare the speed of three method of search (linear – binary – jump)by create array with 100 random number 5 time and get the average time of search in each case.
